

5:57 PM

Waiting for Comaru, 5.9

The Key to this climb is fall line management.
Trailing left hand rope until reaching
A pivot point way higher. Then, you have
Client #1 on left rope and cleaning all of
pro on lower traverses

Stretch-step left foot low, not in slanting crack

Try not to protect this too high, so that Client #1 can instead pivot off Anchor

Crack under overhang

Base is stable, so anchoring belayer not necessary.
